

# Bonus Assignment #1

(or equivalently, Programming Assignment #0)

Ming-Hwa Wang, Ph.D.  
Department of Computer Engineering  
Santa Clara University

## Submit and Autotest Trying Out

if this is the first time you login your Unix/Linux account, do the following (never need to do it again afterward) to protect your intellectual property:

```
$ cd
$ cd ..
$ ls -l | grep <yourLoginName>
drwx----- 1 root root <date_time> <yourLoginName> ...
if output is not begin with drwx-----, then do the following:
$ chmod 700 <yourLoginName>
```

These are the steps to submit your program using perl scripts:

1. Get Perl scripts by soft link and copy the whole P0 (watch the uppercase P) directory to your home directory:

```
$ cd
$ ln -s /home/mwang2/bin/Submit<courseDigits> Submit
$ ln -s /home/mwang2/bin/Autotest<courseDigits> Autotest
$ cp -r /home/mwang2/P0 .
$ cd P0
```

2. Choose Makefile and put your personal information in the source file:

- a) if you program in C/C++, do:

```
$ rm *.java Makefile_Java P0.py
$ mv Makefile_C Makefile
```

edit the info.cpp file

- b) if you program in Java, do:

```
$ rm *.cpp *.hpp Makefile_C P0.py
$ mv Makefile_Java Makefile
```

edit P0.java

- b) if you program in Python, do:

```
$ rm *.java Makefile_Java *.cpp *.hpp Makefile_C Makefile
edit P0.py
```

**NOTE:** You must change ALL my information to yours before go to next step, I need your name and ID to activate your password for accessing solutions under password protected area on my website. Since your school account will expire after you graduated, please also share me your personal email account.

**NOTE:** Your Makefile must have a "clean" target which removes all executable, object, and core files to save bandwidth and to prevent filtered by the spam filter. If your submission directory contains binary files, you will be prompt for force to submit or not.

3. Trial submission to yourself:

```
$ cd
$ perl Submit <yourLoginName> /home/<yourLoginName>/P0
```

You can use relative path instead of absolute at end of command above, and if you set the perl path correctly, then you don't need the perl:

```
$ ./Submit <yourLoginName> P0
```

If you set \$PATH environment variable correctly, you can simply do:

```
$ Submit <yourLoginName> P0
```

*The following steps are for graders only, so you can go to step 4 directly.*

```
$ cd ~/AutoTestDir/<yourLoginName>
```

```
$ Mail
```

*save your mail as P0.m (or save the P0.tar.gz if you read email from Window) and exit email, then*

```
$ cd
```

4. Run Autotest:

```
$ perl Autotest 0
```

5. Check output correctness:

```
$ cat AutoTestDir/<yourLoginName>/out
```

if you see succeed, go on, else debug by repeat step 2 to step 5

6. Formal submission:

```
$ perl Submit P0
```

If you take more than one classes from me at the same quarter, then you can make two or more subdirectories under your home directory, make those two soft links under subdirectories, and do Submit/Autotest under those subdirectories.

The idea of Submit is that you must first submit to yourself and then using Autotest to see if everything works. After you make sure everything is fine, do a formal submit. If you need change the program just after a submission, you better wait for long enough (about 15 minutes) and then do another submission. This is because the arriving order of two emails sent out about the same time is nondeterministic, i.e., the first one may arrive after the second. Thus, if your first submission is wrong but the second is correct, and I received the second first and the first second, I'll delete the first one (which is your correct one.)

Since you submit using your Linux/Unix email account, the acknowledgement will reply to the same account when I receive your submission email. You need to login the Linux/Unix email account to know if your submission is received, or you can forward the emails to any of your preferred email account. Please read /home/mwang2/tips/common/email for steps to do email forwarding.
